1.2 Motherboard overview

1.2.1 Before you proceed
Take note of the following precautions before you install motherboard components or change any motherboard settings.

- Unplug the power cord from the wall socket before touching any component.
- Before handling components, use a grounded wrist strap or touch a safely grounded object or a metal object, such as the power supply case, to avoid damaging them due to static electricity.
- Hold components by the edges to avoid touching the ICs on them.
- Whenever you uninstall any component, place it on a grounded antistatic pad or in the bag that came with the component.
- Before you install or remove any component, ensure that the ATX power supply is switched off or the power cord is detached from the power supply. Failure to do so may cause severe damage to the motherboard, peripherals, or components.
Refer to **1.2.9 Internal connectors** and **2.3.1 Rear I/O connection** for more information about rear panel connectors and internal connectors.

1.2.3 Central Processing Unit (CPU)

The motherboard comes with a surface mount LGA1155 socket designed for the Intel® 3rd/2nd Generation Core™ i7 / Core™ i5 / Core™ i3, Pentium™, and Celeron™ processors.

- Ensure that all power cables are unplugged before installing the CPU.
- The LGA1156 CPU is incompatible with the LGA1155 socket. DO NOT install a LGA1156 CPU on the LGA1155 socket.
- Upon purchase of the motherboard, ensure that the PnP cap is on the socket and the socket contacts are not bent. Contact your retailer immediately if the PnP cap is missing, or if you see any damage to the PnP cap/socket contacts/motherboard components. ASUS will shoulder the cost of repair only if the damage is shipment/transit-related.
- Keep the cap after installing the motherboard. ASUS will process Return Merchandise Authorization (RMA) requests only if the motherboard comes with the cap on the LGA1155 socket.
- The product warranty does not cover damage to the socket contacts resulting from incorrect CPU installation/removal, or misplacement/loss/incorrect removal of the PnP cap.
1.2.4 System memory

The motherboard comes with four Double Data Rate 3 (DDR3) Dual Inline Memory Modules (DIMM) slots.

A DDR3 module is notched differently from a DDR or DDR2 module. DO NOT install a DDR or DDR2 memory module to the DDR3 slot.

Recommended memory configurations
Memory configurations
You may install 1GB, 2GB, 4GB and 8GB unbuffered and non-ECC DDR3 DIMMs into the DIMM sockets.

- Memory module with memory frequency higher than 2133 MHz and its corresponding timing or the loaded XMP profile is not the JEDEC memory standard. The stability and compatibility of these memory modules depend on the CPU's capabilities and other installed devices.

- You may install varying memory sizes in Channel A and Channel B. The system maps the total size of the lower-sized channel for the dual-channel configuration. Any excess memory from the higher-sized channel is then mapped for single-channel operation.

- Due to Intel® 2nd generation processors' behavior, DDR3 2200 (and higher), and DDR3 2000/1800 MHz memory modules will run at the default frequency rates of DDR3 2133/1866/1600 MHz.

- According to Intel CPU spec, DIMM voltage below 1.65V is recommended to protect the CPU.

- Always install DIMMs with the same CAS latency. For optimal compatibility, we recommend that you install memory modules of the same version or date code (D/C) from the same vendor. Check with the retailer to get the correct memory modules.

- Due to the memory address limitation on 32-bit Windows OS, when you install 4GB or more memory on the motherboard, the actual usable memory for the OS can be about 3GB or less. For effective use of memory, we recommend that you do any of the following:
  a) Use a maximum of 3GB system memory if you are using a 32-bit Windows OS.
  b) Install a 64-bit Windows OS when you want to install 4GB or more on the motherboard.
  c) For more details, refer to the Microsoft® support site at [http://support.microsoft.com/kb/929605/en-us](http://support.microsoft.com/kb/929605/en-us).

- This motherboard does not support DIMMs made up of 512Mb (64MB) chips or less (Memory chip capacity counts in Megabit, 8 Megabit/Mb = 1 Megabyte/MB).

- The default memory operation frequency is dependent on its Serial Presence Detect (SPD), which is the standard way of accessing information from a memory module. Under the default state, some memory modules for overclocking may operate at a lower frequency than the vendor-marked value. To operate at the vendor-marked or at a higher frequency, refer to section 3.3 Extreme Tweaker menu for manual memory frequency adjustment.

- For system stability, use a more efficient memory cooling system to support a full memory load (4 DIMMs) or overclocking condition.

Side(s): SS - Single-sided   DS - Double-sided DIMM support:

(1) Supports one (1) module inserted into any slot as Single-channel memory configuration. We suggest that you install the module into A2 slot.

(2) Supports two (2) modules inserted into either the red slots or the black slots as one pair of Dual-channel memory configuration. We suggest that you install the modules into slots A2 and B2 for better compatibility.

(4) Supports four (4) modules inserted into both the red and black slots as two pairs of Dual-channel memory configuration.

• ASUS exclusively provides hyper DIMM support function.
• Hyper DIMM support is subject to the physical characteristics of individual CPUs. Load the X.M.P. or D.O.C.P. settings in the BIOS for the hyper DIMM support.
• Visit the ASUS website for the latest QVL.
1.2.5 Expansion slots

Unplug the power cord before adding or removing expansion cards. Failure to do so may cause you physical injury and damage motherboard components.

1.2.6 Onboard buttons and switches

Onboard switches and buttons allow you to fine-tune performance when working on a bare or open-case system. This is ideal for overclockers and gamers who continually change settings to enhance system performance.

1. Power-on button

The motherboard comes with a power-on button that allows you to power up or wake up the system. The button also lights up when the system is plugged to a power source indicating that you should shut down the system and unplug the power cable before removing or installing any motherboard component.

![MAXIMUS V FORMULA Power on button](image)

2. Reset button

Press the reset button to reboot the system.

![MAXIMUS V FORMULA Reset button](image)
3. **GO button**
Press the GO button before POST to enable MemOK! or press it to quickly load the preset profile (GO_Button file) for temporary overclocking when in OS.

4. **Slow Mode switch**
Slow Mode switch allows your system to provide better overclocking margins when using the -10°C cooling system. When enabled, the Slow Mode switch prevents the system from crashing, slows down the CPU, and the system’s tuner will make the adjustments.

Ensure to set the LN2 Mode jumper to [Enable] before using the Slow Mode Switch.
1.2.7 Jumpers

1. LN2 Mode Jumper (3-pin LN2)

When enabled, the LN2 Mode jumper allows your system to eliminate the cold bugs in the processor during POST. It allows the processor to run at an extremely low temperature and helps the system boot fast.

MAXIMUS V FORMULA LN2_MODE
1.2.8 Onboard LEDs

1. Hard Disk LED

The hard disk LED is designed to indicate the hard disk activity. It blinks when data is being written into or read from the hard disk drive. The LED does not light up when there is no hard disk drive connected to the motherboard or when the hard disk drive does not function.

2. GO LED

Blinking: Indicates that MemOK! is enabled before POST.

Lighting: Indicates that the system loads the preset profile (GO_Button file) for temporary overclocking when in OS.
3. **Q LED**

Q LEDs check key components (CPU, DRAM, VGA card, and booting devices) in sequence during motherboard booting process. If an error is found, the corresponding LED will continue lighting until the problem is solved. This user-friendly design provides an intuitive way to locate the root problem within seconds.

![Q LED Diagram](image1)

**MAXIMUS V FORMULA CPU/ DRAM/ VGA/ BOOT DEVICE LED**

4. **Power LED**

The motherboard comes with a power-on button that lights up to indicate that the system is ON, in sleep mode, or in soft-off mode. This is a reminder that you should shut down the system and unplug the power cable before removing or plugging in any motherboard component. The illustration below shows the location of the onboard power-on button.

![Power LED Diagram](image2)

**MAXIMUS V FORMULA Power on button**
4. **Q-Code LEDs**

The Q-Code LED design provides you with a 2-digit error code that displays the system status. Refer to the Q-Code table on the next page for details.

   ![MAXIMUS V FORMULA Intel® SATA 6.0 Gb/s connectors](image)

   **NOTE:** Connect the right-angle side of SATA signal cable to SATA device. You may also connect the right-angle side of SATA cable to the onboard SATA port to avoid mechanical conflict with huge graphics cards.

   - These connectors are set to **[AHCI Mode]** by default. If you intend to create a Serial ATA RAID set using these connectors, set the SATA Mode item in the BIOS to **[RAID Mode]**. Refer to section **3.5.3 SATA Configuration** for details.
   - Before creating a RAID set, refer to section **5.1 RAID configurations** or the manual bundled in the motherboard support DVD.
   - When using NCQ, set the SATA Mode in the BIOS to **[AHCI Mode]**. Refer to section **3.5.3 SATA Configuration** for details.
   - You must install Windows® XP Service Pack 3 or later versions before using Serial ATA hard disk drives. The Serial ATA RAID feature is available only if you are using Windows® XP SP3 or later versions.
2. **Intel® Z77 Serial ATA 3.0 Gb/s connectors (7-pin SATA3G_34/5 [black])**

These connectors connect to Serial ATA 3.0 Gb/s hard disk drives and optical disc drives via Serial ATA 3.0 Gb/s signal cables.

If you installed Serial ATA hard disk drives, you can create a RAID 0, 1, 5, and 10 configuration with the Intel® Rapid Storage Technology through the onboard Intel® Z77 chipset.

- These connectors are set to [AHCI Mode] by default. If you intend to create a Serial ATA RAID set using these connectors, set the SATA Mode item in the BIOS to [RAID Mode]. Refer to section 3.5.3 SATA Configuration for details.
- Before creating a RAID set, refer to section 5.1 RAID configurations or the manual bundled in the motherboard support DVD.
- When using NCQ, set the SATA Mode in the BIOS to [AHCI Mode]. Refer to section 3.5.3 SATA Configuration for details.

3. **Asmedia® Serial ATA 6.0 Gb/s connectors (7-pin SATA6G_E12/E34 [red])**

These connectors connect to Serial ATA 6.0 Gb/s hard disk drives via Serial ATA 6.0 Gb/s signal cables.

You must install Windows® XP Service Pack 3 or later versions before using Serial ATA hard disk drives.
4. **USB 3.0 connector (20-1 pin USB3_12)**

This connector is for the additional USB 3.0 ports, and complies with the USB 3.0 specification that supports up to 480 MBps connection speed. If the USB 3.0 front panel cable is available from your system chassis, with this USB 3.0 connector, you can have a front panel USB 3.0 solution.

![MAXIMUS V FORMULA USB3.0 connector](image)

Due to Intel® limitations, USB3_12 connector ports run at USB 3.0 speed rate under Windows® 7 or later versions.

5. **Digital audio connector (4-1 pin SPDIF_OUT)**

This connector is for an additional Sony/Philips Digital Interface (S/PDIF) port. Connect the S/PDIF Out module cable to this connector, then install the module to a slot opening at the back of the system chassis.

![MAXIMUS V FORMULA Digital audio connector](image)

The S/PDIF module is purchased separately.
6. **USB 2.0 connectors (10-1 pin USB56; USB78)**

These connectors are for USB 2.0 ports. Connect the USB module cable to any of these connectors, then install the module to a slot opening at the back of the system chassis. These USB connectors comply with USB 2.0 specification that supports up to 48 MBps connection speed.

Never connect a 1394 cable to the USB connectors. Doing so will damage the motherboard!

You can connect the front panel USB cable to the ASUS Q-Connector (USB, blue) first, and then install the Q-Connector (USB) to the USB connector onboard if your chassis supports front panel USB ports.

The USB 2.0 module is purchased separately.
7. CPU, chassis, and optional fan connectors
(4-pin CPU_FAN; 4-pin CPU_OPT; 4-pin CHA_FAN1-3; OPT_FAN1-3)

Connect the fan cables to the fan connectors on the motherboard, ensuring that the
black wire of each cable matches the ground pin of the connector.

![MAXIMUS V FORMULA Fan connectors](image)

DO NOT forget to connect the fan cables to the fan connectors. Insufficient air flow inside
the system may damage the motherboard components. These are not jumpers! Do not
place jumper caps on the fan connectors!

- The CPU_FAN connector supports the CPU fan of maximum 1A (12 W) fan power.
- If you install two VGA cards, we recommend that you plug the rear chassis fan cable
to the motherboard connector labeled CHA_FAN1, CHA_FAN2, CHA_FAN3 for better
thermal environment.
8. Front panel audio connector (10-1 pin AAFP)

This connector is for a chassis-mounted front panel audio I/O module that supports either HD Audio or legacy AC'97 audio standard. Connect one end of the front panel audio I/O module cable to this connector.

- We recommend that you connect a high-definition front panel audio module to this connector to avail of the motherboard’s high-definition audio capability.

- If you want to connect a high-definition or an AC’97 front panel audio module to this connector, set the Front Panel Type item in the BIOS setup to [HD] or [AC97].
9. **ATX power connectors (24-pin EATXPWR; 8-pin EATX12V; 4-pin EZ PLUG)**

These connectors are for ATX power supply plugs. The power supply plugs are designed to fit these connectors in only one orientation. Find the proper orientation and push down firmly until the connectors completely fit.

- For a fully configured system, we recommend that you use a power supply unit (PSU) that complies with ATX 12 V Specification 2.0 (or later version) and provides a minimum power of 350 W.
- Do not forget to connect the 4-pin/8-pin EATX12 V power plug. Otherwise, the system will not boot.
- We recommend that you use a PSU with a higher power output when configuring a system with more power-consuming devices. The system may become unstable or may not boot up if the power is inadequate.
- If you want to use two or more high-end PCI Express x16 cards, use a PSU with 1000W power or above to ensure the system stability.
- If you are uncertain about the minimum power supply requirement for your system, refer to the Recommended Power Supply Wattage Calculator at [http://support.asus.com/PowerSupplyCalculator/PSCalculator.aspx?SLanguage=en-us](http://support.asus.com/PowerSupplyCalculator/PSCalculator.aspx?SLanguage=en-us) for details.
10. **System panel connector (20-8 pin PANEL)**
This connector supports several chassis-mounted functions.

- **System power LED (2-pin PLED)**
  This 2-pin connector is for the system power LED. Connect the chassis power LED cable to this connector. The system power LED lights up when you turn on the system power, and blinks when the system is in sleep mode.

- **Hard disk drive activity LED (2-pin IDE_LED)**
  This 2-pin connector is for the HDD Activity LED. Connect the HDD Activity LED cable to this connector. The IDE LED lights up or flashes when data is read from or written to the HDD.

- **System warning speaker (4-pin SPEAKER)**
  This 4-pin connector is for the chassis-mounted system warning speaker. The speaker allows you to hear system beeps and warnings.

- **ATX power button/soft-off button (2-pin PWRSW)**
  This connector is for the system power button. Pressing the power button turns the system on or puts the system in sleep or soft-off mode depending on the BIOS settings. Pressing the power switch for more than four seconds while the system is ON turns the system OFF.

- **Reset button (2-pin RESET)**
  This 2-pin connector is for the chassis-mounted reset button for system reboot without turning off the system power.
11. **TPM connector (20-1 pin TPM)**

This connector supports a Trusted Platform Module (TPM) system, which securely store keys, digital certificates, passwords and data. A TPM system also helps enhance network security, protect digital identities, and ensures platform integrity.

![MAXIMUS V FORMULA TPM connector](image)

12. **Thermal sensor cable connectors (2-pin OPT_TEMP1/2/3)**

These connectors are for temperature monitoring. Connect the thermal sensor cables to these connectors and place the other ends to the devices which you want to monitor the temperature. The optional fan 1/2/3 can work with the temperature sensors for a better cooling effect.

![MAXIMUS V FORMULA Thermal sensor cable connectors](image)

- You must enable the **OPT FAN 1/2/3 overheat protection** in BIOS if you connect the thermal sensor cables to these connectors.

- The thermal sensor cables are purchased separately.
13. **ROG Logo LED connector (3-pin ROG)**
   
   This connector is for the box (labeled Republic of Gamers) on the heatpipe assembly. Connect the box’s cable, and it lights up when you turn on the system.
1.2.10 Fusion Thermo

Fusion Thermo is an exclusive ROG heatsink that provides air-cooling and water cooling elements, generating cooler ventilation for your motherboard.

Fusion Thermo contains 100% copper water channel with electro-plated nickel barbs for cooling purpose. It also has an integrated heatpipe wrapped in air-cooling fins that absorbs heat and helps dissipate it throughout the system.

With Fusion Thermo, you have a hybrid air and water cooling system for an optimal cooling performance.

- The Fusion Thermo’s nickel barbs’ outer diameter measure 3/8 inch (10mm). We recommend that you install a 3/8 inch ID tubing, and lock both ends with the bundled clamps that came with the water cooling kit.
- We recommend that you route the water cooling kit from the CPU water block to the Fusion Thermo zone.
- We recommend that you separate the VGA water cooling system and the CPU/VRM water cooling system for an optimal cooling result.
- Ensure to keep the chassis ventilation airflow in one direction.
- Refer to the technical documentation of your water cooling kit for assembly instructions.

2.4 Starting up for the first time

1. After making all the connections, replace the system case cover.
2. Ensure that all switches are off.
3. Connect the power cord to the power connector at the back of the system chassis.
4. Connect the power cord to a power outlet that is equipped with a surge protector.
5. Turn on the devices in the following order:
   a. Monitor
   b. External SCSI devices (starting with the last device on the chain)
   c. System power
6. After applying power, the system power LED on the system front panel case lights up. For systems with ATX power supplies, the system LED lights up when you press the ATX power button. If your monitor complies with the “green” standards or if it has a “power standby” feature, the monitor LED may light up or change from orange to green after the system LED turns on.

The system then runs the power-on self tests (POST). While the tests are running, the BIOS beeps (refer to the BIOS beep codes table) or additional messages appear on the screen. If you do not see anything within 30 seconds from the time you turned on the power, the system may have failed a power-on test. Check the jumper settings and connections or call your retailer for assistance.

BIOS setup

3.1 Knowing BIOS

The new ASUS UEFI BIOS is a Unified Extensible Interface that complies with UEFI architecture, offering a user-friendly interface that goes beyond the traditional keyboard-only BIOS controls to enable a more flexible and convenient mouse input. You can easily navigate the new UEFI BIOS with the same smoothness as your operating system. The term “BIOS” in this user manual refers to “UEFI BIOS” unless otherwise specified.

BIOS (Basic Input and Output System) stores system hardware settings such as storage device configuration, overclocking settings, advanced power management, and boot device configuration that are needed for system startup in the motherboard CMOS. In normal circumstances, the default BIOS settings apply to most conditions to ensure optimal performance.

DO NOT change the default BIOS settings except in the following circumstances:

- An error message appears on the screen during the system bootup and requests you to run the BIOS Setup.
- You have installed a new system component that requires further BIOS settings or update.

Inappropriate BIOS settings may result to instability or boot failure. We strongly recommend that you change the BIOS settings only with the help of a trained service personnel.

When downloading or updating the BIOS file, rename it as MVF.CAP for this motherboard.
Chapter 3: BIOS setup

3.2 BIOS setup program

Use the BIOS Setup to update the BIOS or configure its parameters. The BIOS screen include navigation keys and brief onscreen help to guide you in using the BIOS Setup program.

Entering BIOS at startup

To enter BIOS Setup at startup:

• Press <Delete> during the Power-On Self Test (POST). If you do not press <Delete>, POST continues with its routines.

Entering BIOS Setup after POST

To enter BIOS Setup after POST:

• Press <Ctrl>+<Alt>+<Delete> simultaneously.
• Press the reset button on the system chassis.
• Press the power button to turn the system off then back on. Do this option only if you failed to enter BIOS Setup using the first two options.

• The BIOS setup screens shown in this section are for reference purposes only, and may not exactly match what you see on your screen.

• Ensure that a USB mouse is connected to your motherboard if you want to use the mouse to control the BIOS setup program.

• If the system becomes unstable after changing any BIOS setting, load the default settings to ensure system compatibility and stability. Select the Load Optimized Defaults item under the Exit menu or press hotkey <F5>. See section 3.9 Exit Menu for details.

• If the system fails to boot after changing any BIOS setting, try to clear the CMOS and reset the motherboard to the default value. See section 1.2.6 Onboard buttons and switches for information on how to erase the RTC RAM via the Clear CMOS button.

• The BIOS setup program does not support the bluetooth devices.

BIOS menu screen

The BIOS Setup program can be used under two modes: EZ Mode and Advanced Mode. You can change modes from the Exit menu or from the Exit/Advanced Mode screen.
3.2.1 EZ Mode

3.10  Updating BIOS

The ASUS website publishes the latest BIOS versions to provide enhancements on system
stability, compatibility, or performance. However, BIOS updating is potentially risky. If there
is no problem using the current version of BIOS, DO NOT manually update the BIOS.
Inappropriate BIOS updating may result in the system’s failure to boot. Carefully follow the
instructions of this chapter to update your BIOS if necessary.

Visit the ASUS website (www.asus.com) to download the latest BIOS file for this
motherboard.

The following utilities allow you to manage and update the motherboard BIOS setup program.

1. ASUS Update: Updates the BIOS in Windows® environment.
2. ASUS EZ Flash 2: Updates the BIOS using a USB flash drive.
3. ASUS CrashFree BIOS 3: Restores the BIOS using the motherboard support DVD or a
   USB flash drive when the BIOS file fails or gets corrupted.
4. ASUS BIOS Updater: Updates and back ups the BIOS in DOS environment using the
   motherboard support DVD and a USB flash disk drive.

Save a copy of the original motherboard BIOS file to a USB flash disk in case you need to
restore the BIOS in the future. Copy the original motherboard BIOS using the ASUS Update
or BIOS Updater utilities.

3.10.1  ASUS Update

The ASUS Update is a utility that allows you to manage, save, and update the motherboard

RAID support

5.1 RAID configurations
The motherboard supports the following SATA RAID solutions:

- Intel® Rapid Storage Technology with RAID 0, RAID 1, RAID 10 and RAID 5 support.

You must install Windows® XP Service Pack 3 or later versions before using Serial ATA hard disk drives. The Serial ATA RAID feature is available only if you are using Windows® XP SP3 or later versions.

Due to Windows® XP limitation, a RAID array with the total capacity over 2TB cannot be set as a boot disk. A RAID array over 2TB can only be set as a data disk only.

If you want to install a Windows® operating system to a hard disk drive included in a RAID set, you have to create a RAID driver disk and load the RAID driver during OS installation. Refer to section 5.2 Creating a RAID driver disk for details.

5.1.1 RAID definitions

RAID 0 (Data striping) optimizes two identical hard disk drives to read and write data in parallel, interleaved stacks. Two hard disks perform the same work as a single drive but at a sustained data transfer rate, double that of a single disk alone, thus improving data access and storage. Use of two new identical hard disk drives is required for this setup.

RAID 1 (Data mirroring) copies and maintains an identical image of data from one drive to a second drive. If one drive fails, the disk array management software directs all applications to the surviving drive as it contains a complete copy of the data in the other drive. This RAID configuration provides data protection and increases fault tolerance to the entire system. Use two new drives or use an existing drive and a new drive for this setup. The new drive must be of the same size or larger than the existing drive.

RAID 5 stripes both data and parity information across three or more hard disk drives. Among the advantages of RAID 5 configuration include better HDD performance, fault tolerance, and higher storage capacity. The RAID 5 configuration is best suited for transaction processing, relational database applications, enterprise resource planning, and other business systems. Use a minimum of three identical hard disk drives for this setup.

RAID 10 is data striping and data mirroring combined without parity (redundancy data) having to be calculated and written. With the RAID 10 configuration you get all the benefits of both RAID 0 and RAID 1 configurations. Use four new hard disk drives or use an existing drive and three new drives for this setup.
5.1.2 Installing Serial ATA hard disks
The motherboard supports Serial ATA hard disk drives. For optimal performance, install identical drives of the same model and capacity when creating a disk array.

To install the SATA hard disks for a RAID configuration:
1. Install the SATA hard disks into the drive bays.
2. Connect the SATA signal cables.
3. Connect a SATA power cable to the power connector on each drive.

5.1.3 Setting the RAID item in BIOS
You must enable the RAID function in the BIOS Setup before creating RAID sets using SATA HDDs. To do this:
1. Enter the BIOS Setup during POST.
2. Go to the Advanced menu > SATA Configuration, and then press <Enter>.
3. Set the SATA Mode item to [RAID Mode].
4. Save your changes, and then exit the BIOS Setup.

Refer to Chapter 3 for details on entering and navigating through the BIOS Setup

Due to chipset limitation, when SATA ports are set to RAID mode, all SATA ports run at RAID mode together.
5.1.4 Intel® Rapid Storage Technology Option ROM utility

To enter the Intel® Rapid Storage Technology Option ROM utility:

1. Turn on the system.
2. During POST, press <Ctrl> + <I> to display the utility main menu.

The navigation keys at the bottom of the screen allow you to move through the menus and select the menu options.

The RAID BIOS setup screens shown in this section are for reference only and may not exactly match the items on your screen.

The utility supports maximum four hard disk drives for RAID configuration.
Creating a RAID set

To create a RAID set:

1. From the utility main menu, select **1. Create RAID Volume** and press <Enter>. The following screen appears:

![CREATE VOLUME MENU]

**Name:**

5. Use the up/down arrow key to select a drive, and then press <Space> to select. A small triangle marks the selected drive. Press <Enter> after completing your selection.

6. Use the up/down arrow key to select the stripe size for the RAID array (for RAID 0, 10 and 5 only), and then press <Enter>. The available stripe size values range from 4KB to 128KB. The following are typical values:

   - RAID 0: 128KB
   - RAID 10: 64KB
   - RAID 5: 64KB

We recommend a lower stripe size for server systems, and a higher stripe size for multimedia computer systems used mainly for audio and video editing.

7. When the Capacity item is selected, enter the RAID volume capacity that you want and press <Enter>. The default value indicates the maximum allowed capacity.

8. When the Create Volume item is selected, press <Enter>. The following warning message appears:

   WARNING: ALL DATA ON SELECTED DISKS WILL BE LOST.
   Are you sure you want to create this volume? (Y/N):

9. Press <Y> to create the RAID volume and return to the main menu, or <N> to go back to the CREATE VOLUME menu.
Deleting a RAID set

Be cautious when deleting a RAID set. You will lose all data on the hard disk drives when you delete a RAID set.

To delete a RAID set:

1. From the utility main menu, select 2. Delete RAID Volume and press <Enter>. The following screen appears:

2. Use the up/down arrow key to select the RAID set you want to delete, and then press <Del>. The following warning message appears:

3. Press <Y> to delete the RAID set and return to the utility main menu, or press <N> to return to the DELETE VOLUME menu.
Exiting the Intel® Rapid Storage Technology Option ROM utility

To exit the utility:

1. From the utility main menu, select **5. Exit**, and then press <Enter>. The following warning message appears:

   ![Confirm Exit Message]

   Are you sure you want to exit? (Y/N):
5.2 Creating a RAID driver disk

A floppy disk with the RAID driver is required when installing a Windows® operating system on a hard disk drive that is included in a RAID set.

- The motherboard does not provide a floppy drive connector. You have to use a USB floppy disk drive when creating a SATA RAID driver disk.
- Windows® XP may not recognize the USB floppy disk drive due to Windows® XP limitation. To work around this OS limitation, refer to section 5.2.4 Using a USB floppy disk drive.

5.2.1 Creating a RAID driver disk without entering the OS

To create a RAID driver disk without entering the OS:

1. Boot your computer.
2. Press <Del> during POST to enter the BIOS setup utility.
3. Set the optical drive as the primary boot device.
4. Insert the support DVD into the optical drive.
5. Save changes and exit BIOS.
6. When the Make Disk menu appears, press <1> to create a RAID driver disk.
7. Insert a formatted floppy disk into the USB floppy disk drive, then press <Enter>.
8. Follow the succeeding screen instructions to complete the process.

5.2.2 Creating a RAID driver disk in Windows®

To create a RAID driver disk in Windows®:

1. Start Windows®.
2. Plug the USB floppy disk drive and insert a floppy disk.
3. Place the motherboard support DVD into the optical drive.

4. Follow the succeeding screen instructions to complete the installation.

Before loading the RAID driver from a USB flash drive, you have to use another computer to copy the RAID driver from the support DVD to the USB flash drive.
5.2.4 Using a USB floppy disk drive

Due to OS limitation, Windows® XP may not recognize the USB floppy disk drive when you install the RAID driver from a floppy disk during the OS installation.

To solve this issue, add the USB floppy disk drive’s Vendor ID (VID) and Product ID (PID) to the floppy disk containing the RAID driver. Refer to the steps below:

1. Using another computer, plug the USB floppy disk drive, and insert the floppy disk containing the RAID driver.

2. Right-click **My Computer** on the Windows® desktop or start menu, and then select **Manage** from the pop-up window.

3. Select **Device Manager**. From the **Universal Serial Bus controllers**, right-click **xxxxxx USB Floppy**, and then select **Properties** from the pop-up window.

   The name of the USB floppy disk drive varies with different vendors.

4. Click **Details** tab. The Vendor ID (VID) and Product ID (PID) are displayed.

5. Browse the contents of the RAID driver disk to locate the file **txtsetup.oem**.

6. Double-click the file. A window appears, allowing you to select the program for opening the oem file.
7. Use Notepad to open the file.

9. Type the following line to the bottom of the two sections:

   \[ id = \text{``USB\%VID\_xxxx\&PID\_xxxx'', `usbstor''} \]

Add the same line to both sections.

The VID and PID vary with different vendors.

10. Save and exit the file.

7.1 Intel® 2012 Desktop responsiveness technologies

This section details the overview of the installation and configuration procedures of the Intel® 2012 Desktop responsiveness technologies.

Intel® 2012 Desktop responsiveness technologies feature the three technologies:

- Intel® Smart Response Technology
- Intel® Rapid Start Technology
- Intel® Smart Connect Technology

System Requirements

In order for the system to run smoothly for the Intel® 2012 Desktop responsiveness, your system must meet the following requirements.

**CPU:** Intel® 3rd/2nd generation Core Processor family

**OS:** Windows® 7 operating systems

**SSD:** One dedicated SSD (Solid State Disk) to support Intel® Smart Response and Intel® Rapid Start Technology is necessary.

Refer to the SSD Capacity Requirements table for the information of SSD size, partition capacity, and system memory requirements.

**HDD:** At least one HDD (Hard Disk Drive) for the system OS drive.

**DRAM:** To enable Intel® Rapid Start Technology, DRAM size smaller than 8GB is required.

Ensure to enable the acceleration of Intel® Smart Response Technology before creating the partition for the Intel® Rapid Start Technology.

- The SSD used for Intel® Rapid Start and Intel® Smart Response is not allowed for creating RAID.
- Due to OS behavior, Intel® Rapid Start Technology does not work efficiently with over 4GB system memory under Windows® 7 32-bit operating system.
- Only Intel® internal SATA ports (gray and blue) support Intel® 2012 Desktop responsiveness technologies.
- The performance of Intel® Smart Response Technology and Intel® Rapid Storage Technology vary with the installed SSD.
7.1.1 Intel® Smart Response Technology

Intel® Smart Response Technology boosts overall system performance. It uses an installed fast SSD (min. 20GB available) as a cache for frequently accessed operations, speeding up hard drive/main memory interaction. It accelerates the hard drive speeds, reduced load and wait time, and maximizes storage use. It also reduces hard drive spin thus reducing unnecessary hard drive spin.

Before applying Intel® Smart Response Technology, setting the SATA Mode BIOS item to [RAID mode] in BIOS setup is necessary. Refer to section 3.5.3 SATA Configuration for details.

Installing Intel® Smart Response Technology

1. Place the support DVD to the optical drive. If Autorun is enabled in your computer, the DVD automatically displays the installation wizard.
2. Click the Drivers tab, then click Intel® Rapid Storage Technology Driver software.
3. Follow the onscreen instructions to complete the installation.

Using the Intel® Smart Response Technology

1. Click Accelerate to launch Smart Response Technology settings.
2. Do the following:
   a. Select the SSD you want to use to accelerate your storage system.
   b. Select the size allocated for SSD caching.
   c. Select the hard drive to accelerate.
   d. Select any of these enhanced modes:
      - **Enhanced mode**: WRITE THROUGH, write to SSD and HDD at the same time.
      - **Maximized mode**: WRITE BACK, write to SSD and write back to HDD in a later time.
3. Select **Disable Acceleration** to disable this function, and select **Change Mode** to switch acceleration mode to Enhanced/Maximized.

- To enable Intel® Smart Response Technology, you need at least one SSD (≥ 20GB) and an HDD, and only one SSD can be assigned for caching.
- If you want to restore the OS, go to BIOS Option ROM > Acceleration Options and remove the Disks/Volume Acceleration to disable Intel® Smart Response Technology.
- The maximum caching size on the SSD is 64GB. If it exceeds, the storage capacity left out for caching can still be identified by the system for normal storage.

### 7.1.2 Intel® Rapid Start Technology

Intel® Rapid Start Technology allows you to quickly resume your computer from sleeping mode. Saving your computer’s system memory to the configured SSD provides a faster wake-up response time, but keeps the energy in a low profile.

- Before applying Intel® Rapid Start Technology, go to Advanced Mode > Advanced > PCH Configuration in BIOS item, and enable Intel® Rapid Start Technology.
- Ensure to follow the procedure **Creating a partition** precisely to enable the Intel Rapid Start function. Error message appears if you install the Intel® Rapid Start Utility before creating a partition.

### Creating a partition

- Ensure to backup your data before using the Microsoft partition tool. Incorrect partitioning process will result to data loss.
- Adjusting the DRAM to a high frequency will result to unstable system performance.

1. Go to Start, right-click **Computer** > **Manage** > **Disk Management**.
2. Select the SSD that you want to create the partition.
3. Right click the New Volume that you want to shrink from, and select Shrink Volume.

4. If your SSD is not initialized and unformatted:
   a. Right click the disk that you want to create the partition, and select Initialize.
   b. Right click the unallocated volume, select New Simple Volume, and follow the remaining steps.

If your SSD is smaller than 64GB, and is set to Full disk capacity caching option for Intel® Smart Response, you can not see any volume in the Disk Management. Ensure to set your cache memory value of 18.6GB in Intel® Smart Response to allow enough capacity for the Intel® Rapid Start partition.

5. Key in the required partition size, and must be equal to the system DRAM memory (1GB = 1024MB). Click Shrink.

Go to Start > Control Panel > System and Security > System, and check the DRAM size information.

The unallocated volume is allocated to the selected disk.
6. To launch the disk partitioning tool, click Start > Programs > Accessories > Command Prompt tool.

7. Type diskpart and press <Enter>.

8. In the diskpart prompt, type list disk after DISKPART, and press <Enter>. Select the disk with the unallocated volume by typing select disk x (x = disk number), and press <Enter>.

   - The value “x” refers to a disk number where you created the unallocated partition.
   - Refer to step 5 for details about the unallocated disk space in the SSD.

9. Type create partition primary, and press <Enter>.

10. After creating a primary partition, type detail disk, and press <Enter> to view the details of the partitioned disk.

11. Select the RAW volume which has the same size as the shrinked volume, type select volume x (x = number), and press Enter to store the Intel® Rapid Start partition.

   - The value “x” refers to a disk number where you want to create the store partition.
12. Type `set id=84 override`, press <Enter>, and wait for the “shrinking process” until the Disk Management utility identifies a new partition called **Hibernation Partition**.

![Disk Management Utility](image)

The **Hibernation Partition** does not appear when you choose “GPT (GUID Partition Table store type” . Ensure the “Unallocated” disappears from the volume, and a new partition is identified.

13. Reboot the system after creating the partition.

![Reboot Reminder](image)

The partition for Intel® Rapid Start Technology is incomplete if the computer is not rebooted, and this results to function failure of Intel® Rapid Start Technology.

**Enabling and disabling the Intel® Rapid Start Technology under the OS**

Install the Intel® Rapid Start Technology first from your support DVD in order to launch the Intel® Rapid Start Manager.

After creating the partition, launch the Intel® Rapid Start Manager to enable or disable the Intel® Rapid Start Technology.

1. Click the **Show hidden icons** arrow from the right side of the taskbar, and click **Intel® Rapid Start Technology Manager** icon.
2. **Tick On** in the Status field to enable the function, and click **Save**.

---

**Recovering the partition**

This procedure allows you to delete the Intel® Rapid Start Technology from your system, and recover the partition you made for the Intel Rapid® Start Technology installation.

1. Run the **Command Prompt** tool.
2. Type `diskpart` and press <Enter>.
3. At the diskpart prompt, type `list disk` after DISKPART, and press <Enter>.
4. Select the disk (SSD) where the Intel® Rapid Start Technology is installed for volume recovery, type `select disk x` (x = number), and press <Enter>.

---

The value “x” refers to a disk number where you want to delete the store partition.
5. Type list partition, press Enter, and select the partition where the Intel® Rapid Start Technology is installed by typing select partition \( x \) (\( x \) = number), and press <Enter>.

The value “\( x \)” refers to a disk number where you want to delete the store partition.

6. Type delete partition override, and press <Enter>. The diskpart utility deletes the selected partition.

7. In the desktop, click Start, right-click Computer, and click Manage.

8. In the Computer Management window, click Disk Management, right click the shrinked new volume, and select Extend Volume.

9. As the Extend Volume Wizard appears, click Next.
10. Click **Next** after selecting the default selected disk.

11. Extend volume setup is completed. Click **Finish** to recover the Intel® Rapid Start Technology partition.

12. Reboot the system after deleting the partition.

13. Go to **Start > Control Panel > Programs > Programs and Features** to remove the Intel® Rapid Start Manager for the complete deletion of Intel® Rapid Start Technology.

### 7.1.3 Intel® Smart Connect Technology

The Intel® Smart Connect Technology is a feature that provides the latest content updates and energy efficiency to your computer’s platform.

- Intel® Smart Connect Technology supports Windows® Live Mail, Microsoft Outlook, and Seesmic applications.
- It is necessary to enable the items of the PCH Configuration in the BIOS before applying the Intel® Smart Connect Technology. Go to **Advanced Mode > Advanced > PCH Configuration**, and enable the Intel® Smart Connect Technology.

### Installing the Intel® Smart Connect Technology

1. Place the support DVD to the optical drive.

2. Go to **Utilities**, and click Intel® Smart Connect Technology.

3. As the setup wizard appears, click **Next** to begin the setup.

4. Tick **I accept the terms in the License Agreement**, and click **Next**.

5. Select all and click **Next** for Custom Setup.

6. Click **Install** to proceed the installation.

7. Click **Yes** to restart your system, and for the newly installed Intel® Smart Connect Technology to take effect.
Using the Intel® Smart Connect Technology

• Before the system goes to sleep mode, ensure to keep your applications on the desktop, and enter the applications, passwords.
• Ensure that the internet is in connection when enabling the Intel® Smart Connect Technology.

1. Click Start > All Programs > Intel > Intel® Smart Connect Technology.

2. In the Basic tab, click Enable Updating. When enabled, the Advanced tab is available for advanced function settings.

3. To disable the updating function, click Disable Updating. Clicking this button automatically disables the configuration in the Advanced tab. To reset to defaults, click Reset All to Defaults.
4. In the **Advanced** tab, set up the schedule during low power usage time period for power saving. This setting only applies to the assigned time period.
